

ADAPTIVE DIFFERENTIAL PULSE CODE MODULATION SYSTEM AND
METHOD UTILIZING WHITENING FILTER
FOR UPDATING OF PREDICTOR COEFFICIENTS

5

ABSTRACT OF THE DISCLOSURE

An improved technique for processing digital audio signals is provided wherein adaptation of predictor coefficients in an ADPCM environment is caused to converge in a rapid and computationally efficient manner. The technique employs a whitening filter to generate a filtered reconstructed signal which is utilized to update, or adapt, the prediction coefficients of a pole-based predictor.
